

Prevalence of [autoimmune disease](#) in patients with [prolactinomas](#) and [non-functioning pituitary adenomas](#)

Prolactin can affect autoimmune response, and evidence suggests that hyperprolactinemia can primarily precipitate autoimmunity. We postulate that patients with prolactinomas are more prone to autoimmune disease (AID).

Methods: A cross-sectional study comparing prevalence of AID in 100 prolactinoma patients (PRL) and 100 non-functioning pituitary adenoma patients (NFPA).

Covariates:

Age at diagnosis of pituitary adenoma

Ethnicity: Caucasian vs non-Caucasian

Largest diameter of adenoma (mm) on imaging at diagnosis

Sex
